

Design Your Supply Chain Run with Digital Twin

Timofey Popkov, Anatoly Zherebtscov
ALC 2019, Austin, TX

Workshop Agenda

Supply Chain Digital Twin with anyLogistix

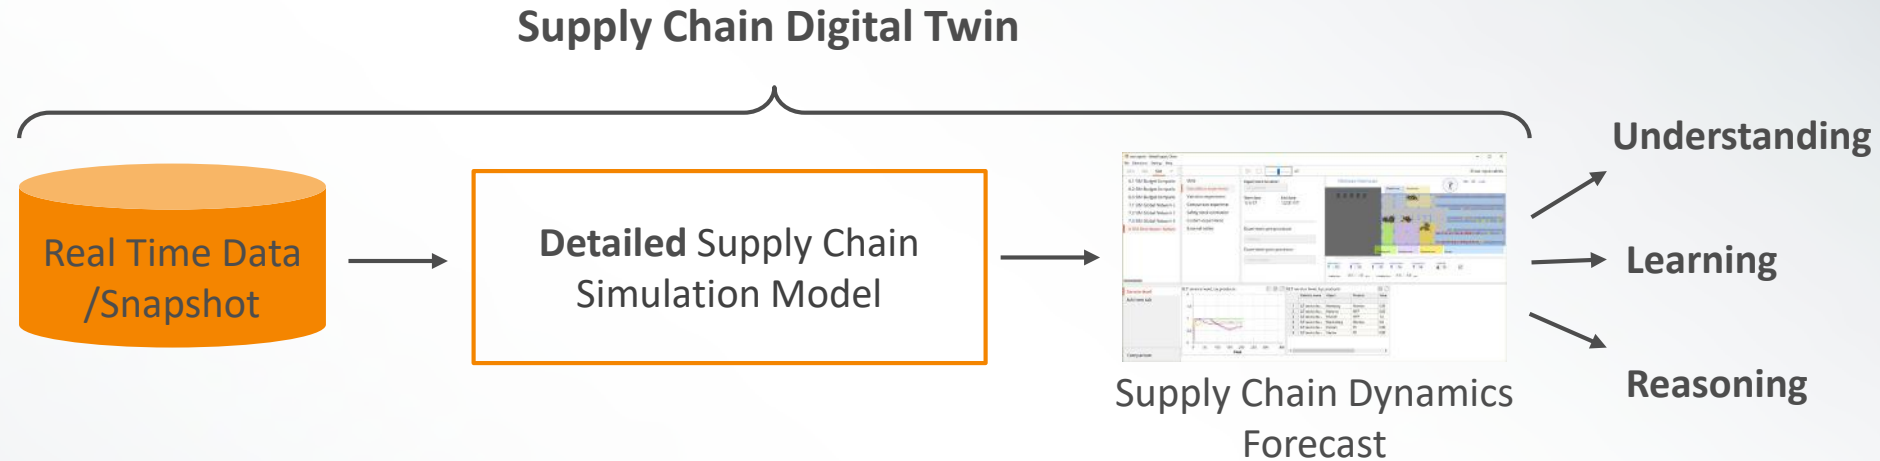

AnyLogic + anyLogistix + AnyLogic Private Cloud

Q&A

What is a Digital Twin

- Definition by Gartner:
 - A **digital twin** is a digital representation of a real-world entity or system
- Some definitions from Wikipedia:
 - A Digital Twin is an integrated multiphysics, multiscale, probabilistic **simulation** of an as-built **vehicle** or system that uses the best available physical models, **sensor updates**, fleet history, etc., to mirror the life of its corresponding flying twin
 - Coupled model of the **real machine** that operates in the cloud platform and **simulates** the health condition with an integrated knowledge from both data driven analytical algorithms as well as other available physical knowledge
 - A **dynamic** virtual representation of a **physical object or system** across its lifecycle, using **real-time data** to enable **understanding, learning and reasoning**
 - ...
- The words most often used to describe a Digital Twin
 - Simulation, real-time data, dynamic, understanding, learning, reasoning

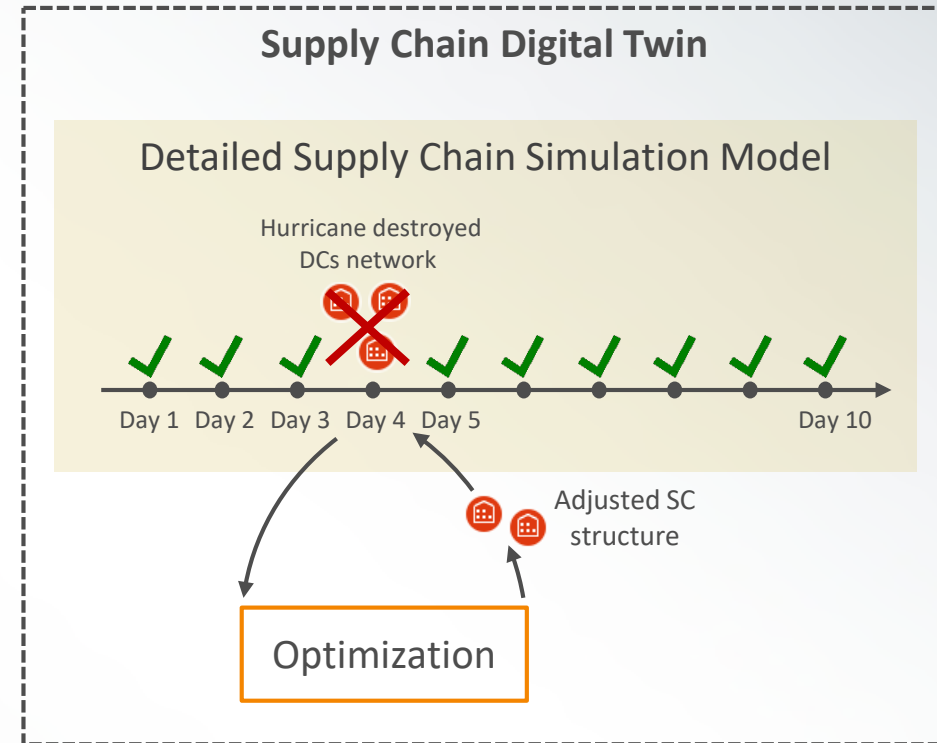

A Digital Twin in Supply Chain

- A supply chain digital twin is a detailed simulation model of an actual supply chain which predicts the behavior and dynamics of a supply chain to make mid-term/short-term decisions:
 - **Mid-term decisions** are mostly related to how a supply chain should work i.e. supply chain processes/resources/logic. It may require you to simulate a **few months** of operations.
 - **Short-term decisions** are mostly related to the identification of problems and the analysis of solutions. It may require the simulation of a **few days or weeks**.

Digital Twin: Is There a Space for Optimization

- Optimization, analytics, and AI can be part of a digital twin
- Optimization, analytics, and AI can be used by a simulation model to make decisions in certain situations
- Simulation is used to forecast the dynamics of a supply chain

What Makes a Supply Chain Simulation Model a Digital Twin

- A digital twin is a detailed simulation model of a supply chain
 - A digital twin should be able to predict the behavior of a supply chain

- Integration with IT infrastructure
 - In many cases a digital twin is part of a “bigger thing” e.g. a control tower, and should be able to integrate with its surrounding IT environment

- Test an action plan
 - A digital twin should allow you to test actions to efficiently manage your supply chain

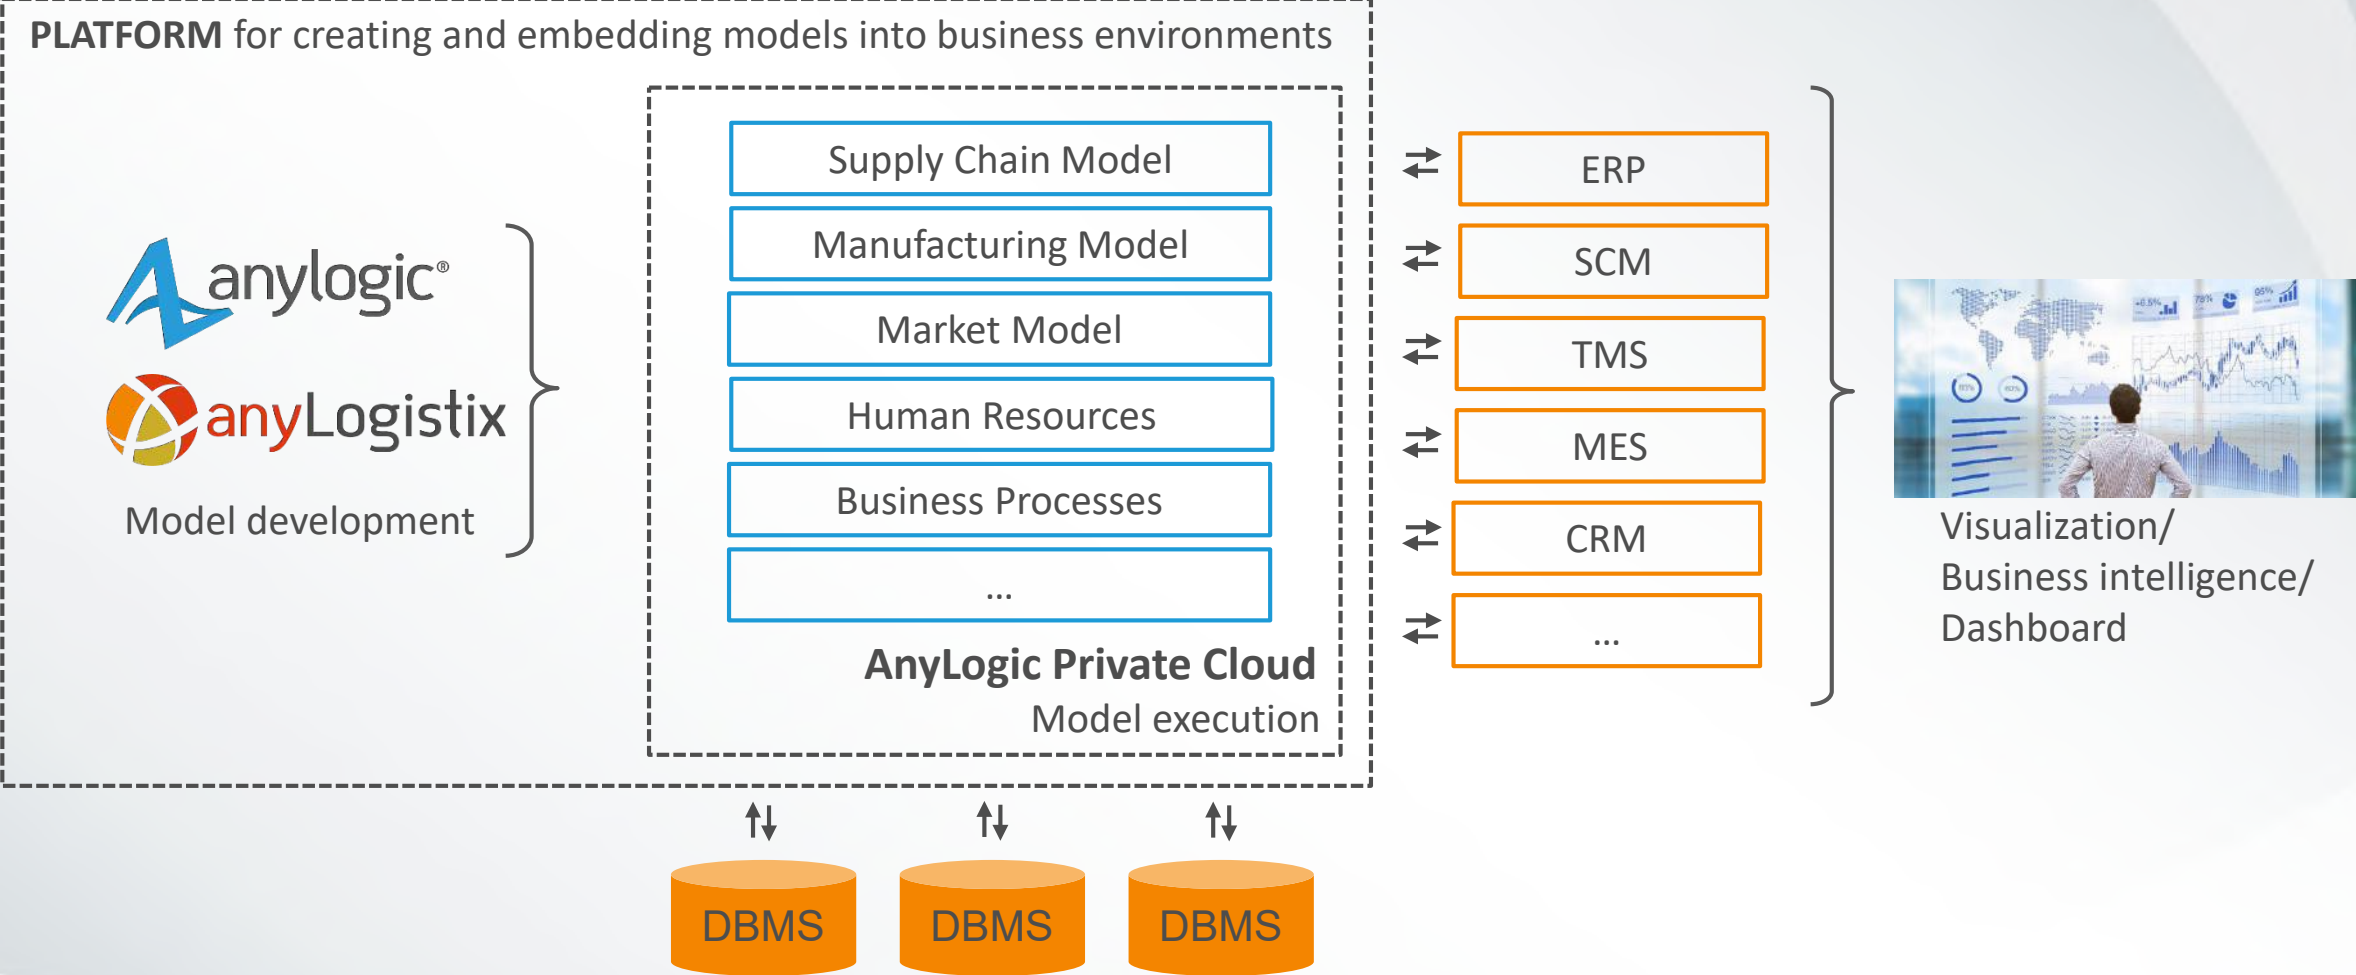

- Real Time Data/Snapshot
 - A digital twin uses real time data to make forecasts
- Notifications/alarms/alerts about abnormal situations
 - A digital twin should allow you to define what abnormal behaviour is and send notifications about critical/abnormal situations
- Triggers
 - A digital twin should allow the definition of automatic actions for some events

An aerial photograph of a rugged mountain peak rising above a vast, undulating sea of white clouds. The sun is setting on the right side of the frame, casting a warm, golden glow over the clouds and the sky. The sky is filled with large, dark, dramatic clouds, some of which are illuminated from below by the setting sun. The overall scene is majestic and serene.

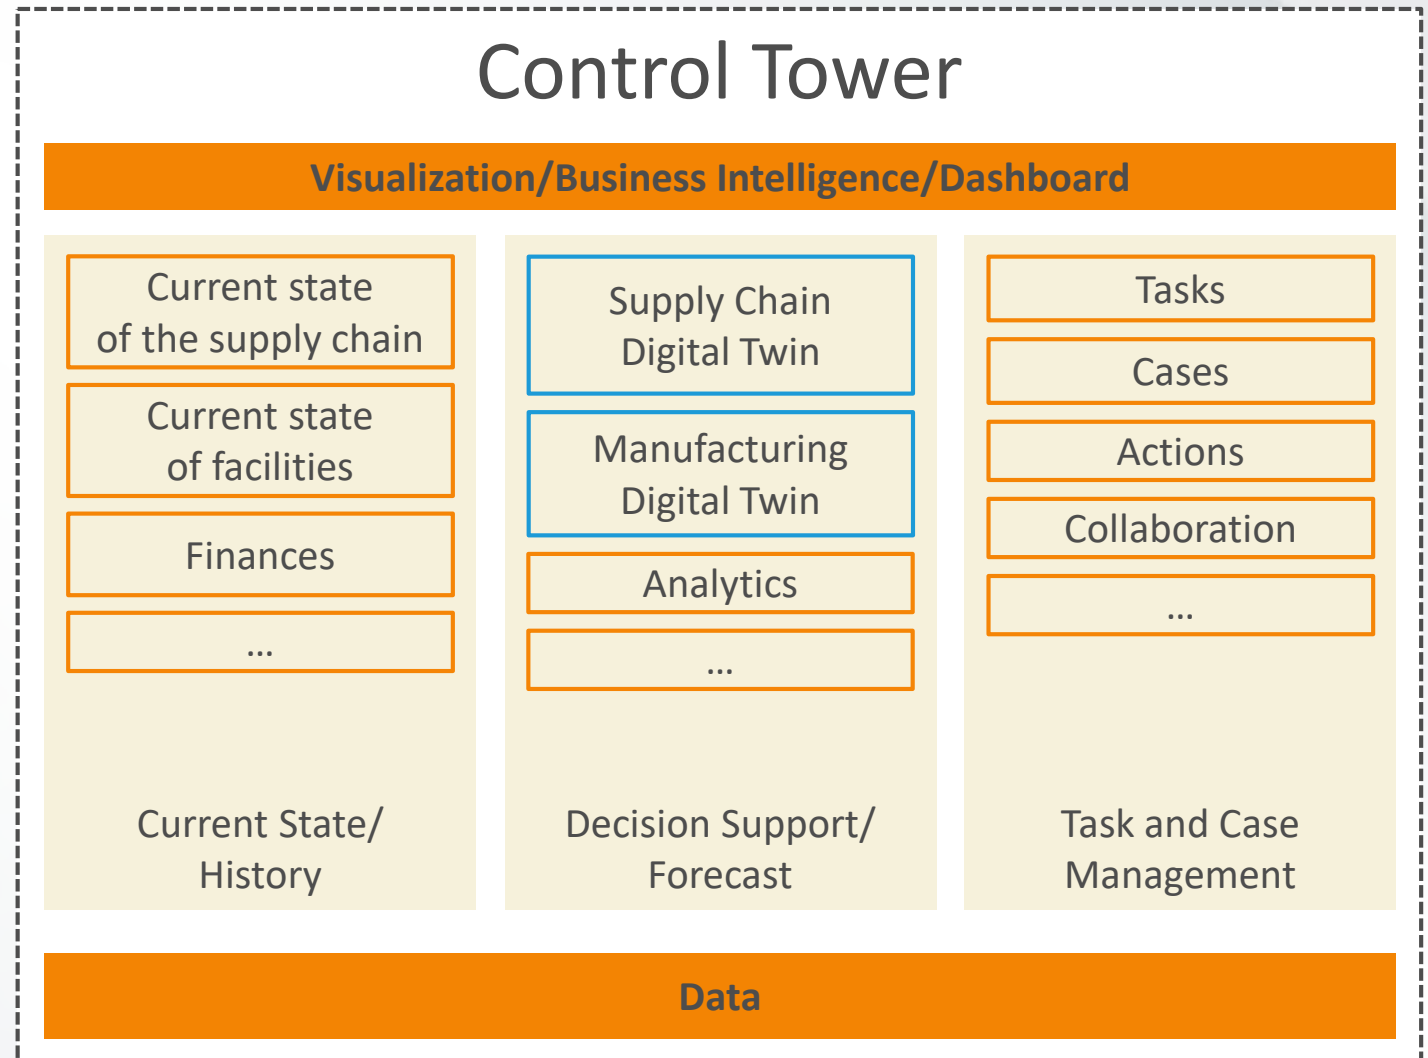

AnyLogic + anyLogistix + AnyLogic Private Cloud

Example: Control Tower

- A control tower – a central hub with the necessary technology, organization and processes for capturing and using data to provide enhanced visibility for short-, mid- and long-term decision-making, in alignment with company objectives.
